Here are a couple of examples of the Gram-Schmidt orthogonalization procedure. The recipe for generating an orthonormal basis  $e_i$  from a general set of linearly independent vectors  $v_i$  is as follows.

The first vector  $e_1$  in the orthonormal basis is defined by

$$(0.1) \quad e_1 = \frac{v_1}{|v_1|}$$

where  $v_1$  is the first vector (well, any vector, really) in the non-orthonormal basis.

Given vector  $e_{j-1}$  in the orthonormal basis, we can form  $e_j$  from the formula

$$(0.2) \quad e_j = \frac{v_j - \sum_{i=1}^{j-1} \langle e_i, v_j \rangle e_i}{\left| v_j - \sum_{i=1}^{j-1} \langle e_i, v_j \rangle e_i \right|}$$

**Example 1.** Given  $v_1 = (3, 4)$  and  $v_2 = (2, -6)$  we can form an orthonormal basis in two ways. Starting with  $v_1$  we have

$$(0.3) \quad e_1 = \frac{v_1}{|v_1|} = \left( \frac{3}{5}, \frac{4}{5} \right)$$

$$(0.4) \quad e_2 = \frac{v_2 - \langle e_1, v_2 \rangle e_1}{\left| v_2 - \langle e_1, v_2 \rangle e_1 \right|}$$

To evaluate  $e_2$ , we have

$$(0.5) \quad \langle e_1, v_2 \rangle = \frac{6}{5} - \frac{24}{5} = -\frac{18}{5}$$

$$(0.6) \quad v_2 - \langle e_1, v_2 \rangle e_1 = (2, -6) + \frac{18}{5} \left( \frac{3}{5}, \frac{4}{5} \right)$$

$$(0.7) \quad = \frac{1}{25} (104, -78)$$

$$(0.8) \quad |v_2 - \langle e_1, v_2 \rangle e_1| = \frac{130}{25}$$

$$(0.9) \quad e_2 = \frac{1}{130} (104, -78)$$

As a check,

$$(0.10) \quad \langle e_1, e_2 \rangle = \frac{1}{650} (312 - 312) = 0$$

$$(0.11) \quad \langle e_1, e_1 \rangle = \frac{1}{25} (9 + 16) = 1$$

$$(0.12) \quad \langle e_2, e_2 \rangle = \frac{1}{16900} (10816 + 6084) = 1$$

We could also start with  $v_2$ , giving

$$(0.13) \quad e_1 = \frac{v_2}{|v_2|} = \frac{1}{2\sqrt{10}} (2, -6)$$

$$(0.14) \quad e_2 = \frac{v_1 - \langle e_1, v_1 \rangle e_1}{|v_1 - \langle e_1, v_1 \rangle e_1|}$$

$$(0.15) \quad \langle e_1, v_1 \rangle = \frac{1}{2\sqrt{10}} (6 - 24) = -\frac{9}{\sqrt{10}}$$

$$(0.16) \quad v_1 - \langle e_1, v_1 \rangle e_1 = (3, 4) + \frac{9}{20} (2, -6)$$

$$(0.17) \quad = \frac{1}{20} (78, 26)$$

$$(0.18) \quad |v_1 - \langle e_1, v_1 \rangle e_1| = \frac{\sqrt{6760}}{20}$$

$$(0.19) \quad e_2 = \frac{1}{\sqrt{6760}} (78, 26)$$

Checking, we get

$$(0.20) \quad \langle e_1, e_2 \rangle = \frac{1}{2\sqrt{67600}} (156 - 156) = 0$$

$$(0.21) \quad \langle e_1, e_1 \rangle = \frac{1}{40} (4 + 36) = 1$$

$$(0.22) \quad \langle e_2, e_2 \rangle = \frac{1}{6760} (6084 + 676) = 1$$

**Example 2.** We're now given 3 vectors in 3-d space:

$$(0.23) \quad v_1 = (3, 0, 0)$$

$$(0.24) \quad v_2 = (0, 1, 2)$$

$$(0.25) \quad v_3 = (0, 2, 5)$$

The problem is to generate linear combinations of these 3 vectors to give the orthonormal basis

$$(0.26) \quad e_1 = (1, 0, 0)$$

$$(0.27) \quad e_2 = \frac{1}{\sqrt{5}} (0, 1, 2)$$

$$(0.28) \quad e_3 = \frac{1}{\sqrt{5}} (0, -2, 1)$$

We could use the Gram-Schmidt procedure, but it's probably easier to just solve the equations. We have

$$(0.29) \quad e_1 = \frac{v_1}{3}$$

$$(0.30) \quad e_2 = \frac{v_2}{\sqrt{5}}$$

$$(0.31) \quad e_3 = Av_1 + Bv_2 + Cv_3$$

Writing out the last equation using components, we have

$$(0.32) \quad 0 = A$$

$$(0.33) \quad -\frac{2}{\sqrt{5}} = B + 2C$$

$$(0.34) \quad \frac{1}{\sqrt{5}} = 2B + 5C$$

The solution is

$$(0.35) \quad C = \frac{5}{\sqrt{5}} = \sqrt{5}$$

$$(0.36) \quad B = -\frac{12}{\sqrt{5}}$$

Thus we have

$$(0.37) \quad e_1 = \frac{v_1}{3}$$

$$(0.38) \quad e_2 = \frac{v_2}{\sqrt{5}}$$

$$(0.39) \quad e_3 = -\frac{12}{\sqrt{5}}v_2 + \sqrt{5}v_3$$
